Telecomm Quiz/Tutor Bot Report

Course Name: GenAI

Institution Name*:* Medicaps University – Datagami Skill Based Course

Student Name(s) & Enrolment Number(s):

Sr no	Student Name	Enrolment Number
1.	Mohd Dilshad Khan	EN22CS301602
2.	Nishit Sharma	EN22CS301658
3.	Paridhi Gupta	EN22CS301683
4.	Mohd Suhail Khan	EN22CS301604
5.	Nirmal Kant Shrivastava	EN22CS301656

Group Name: Group 08D6

Project Number: GAI-19

Industry Mentor Name:

University Mentor Name: Prof. Ajaj Khan

Academic Year: 2025-2026

Problem Statement & Objectives

1. Problem Statement

The telecom domain involves a wide range of concepts such as mobile plans, data usage, network technologies, and service structures, which can be complex for users to understand. Traditional learning methods and quiz systems often provide only basic evaluation, marking answers as correct or incorrect without offering detailed explanations. This limits the user's ability to identify mistakes and improve their understanding effectively.

Moreover, users lack access to an intelligent system that can provide real-time assistance and personalized guidance in the telecom domain. Existing systems do not adapt to individual learning needs and fail to address knowledge gaps in a structured manner. As a result, users often struggle to build a strong conceptual foundation.

With the advancement of Generative AI and Large Language Models (LLMs), there is an opportunity to create a system that can understand user responses, evaluate them contextually, and provide meaningful feedback. Such a system can enhance learning by offering explanations, clarifying concepts, and guiding users through an interactive process.

Therefore, there is a need to develop an AI-powered Telecom Quiz/Tutor Bot that can provide intelligent answer evaluation, personalized feedback, and chatbot-based assistance. This system aims to improve learning efficiency, user engagement, and conceptual understanding in the telecom domain.

2. Project Objectives

The primary objective of the Telecom Quiz/Tutor Bot is to develop an intelligent and interactive learning system for the telecom domain using Generative AI.

The specific objectives of the project are:

- To develop an AI-based quiz system for telecom-related topics such as mobile plans, data usage, and network technologies.
- To evaluate user answers using a Large Language Model (LLM) for contextual and intelligent assessment.
- To provide detailed feedback and explanations for incorrect or partially correct answers.

- To implement a chatbot that can answer telecom-related queries in real time.
- To identify user weaknesses and provide personalized learning recommendations.
- To enhance user engagement through interactive and adaptive learning methods.
- To design a scalable and modular system architecture for future expansion.
- To integrate modern technologies such as LLM APIs and vector databases for improved system performance.

3. Scope of the Project

The scope of the Telecom Quiz/Tutor Bot project focuses on the design and development of an AI-driven educational system for the telecom domain. The system aims to provide an interactive platform for users to learn and assess their knowledge through quizzes and intelligent feedback.

The project includes the development of a web-based application that allows users to attempt telecom-related quizzes and interact with a chatbot. It supports topics such as mobile plans, data usage, and network technologies. The system evaluates user responses using a Large Language Model (LLM) and provides detailed explanations to improve understanding.

The scope also includes storing user responses, tracking performance, and identifying areas where users need improvement. A vector database is integrated to support the chatbot in retrieving relevant telecom knowledge and generating context-aware responses.

The system is designed with a modular and scalable architecture, enabling future enhancements such as adding more topics, improving AI capabilities, or integrating advanced features.

However, the scope of the project is limited to the learning and evaluation aspects of the telecom domain and does not include real-time telecom service integration or deployment at an enterprise scale.

Proposed Solution

1. Key features

- **AI-Based Answer Evaluation**
  Evaluates user responses using a Large Language Model (LLM), enabling contextual and intelligent assessment instead of simple right/wrong checking.
- **Interactive Quiz System**
  Allows users to attempt telecom-related quizzes on topics such as mobile plans, data usage, and network technologies.
- **Detailed Feedback and Explanation**
  Provides clear explanations for incorrect or partially correct answers to improve conceptual understanding.
- **Chatbot Assistance**
  Enables users to ask telecom-related questions and receive real-time, AIgenerated responses.
- **Personalized Learning Experience**
  Tracks user performance and identifies weak areas to provide targeted learning support.
- **Vector Database Integration**
  Uses a vector database to store telecom knowledge and retrieve relevant context for chatbot responses.
- **Scalable System Architecture**
  Designed to support multiple users and future feature enhancements.
- **User Performance Tracking**
  Stores user responses and scores to monitor progress and learning improvement.

2. System Architecture

The system architecture of the Telecom Quiz/Tutor Bot is designed using a modular and layered approach to ensure scalability, efficiency, and smooth interaction between components. It integrates user interaction, backend processing, AI capabilities, and data storage into a unified system.

Architecture Overview

- **User Interface Layer**
  This layer provides a web-based interface where users can attempt quizzes, submit answers, view results, and interact with the chatbot.
- **Application Layer (Backend)**
  The backend handles request processing, routing, and communication between different components. It receives user inputs from the frontend and forwards them to the appropriate services.
- **AI Processing Layer**
  This layer integrates a Large Language Model (LLM) to perform intelligent tasks such as evaluating quiz answers and generating chatbot responses. It ensures context-aware and meaningful outputs.
- **Data Layer**
  The system uses a relational database to store structured data such as questions, user responses, and results. A vector database is used to store telecom knowledge for efficient retrieval in chatbot interactions.
- **ExternalAI Services**
  The system connects to external LLM APIs (such as OpenAI or Gemini) to leverage advanced natural language processing capabilities.

❖ **Workflow Explanation**

1. The user interacts with the system through the web interface.
2. The request is sent to the backend server.
3. The backend processes the request and communicates with the AI layer.
4. The LLM evaluates answers or generates responses.
5. Data is retrieved or stored in the database as required.
6. The final response is sent back to the user interface.

3. Process Flow

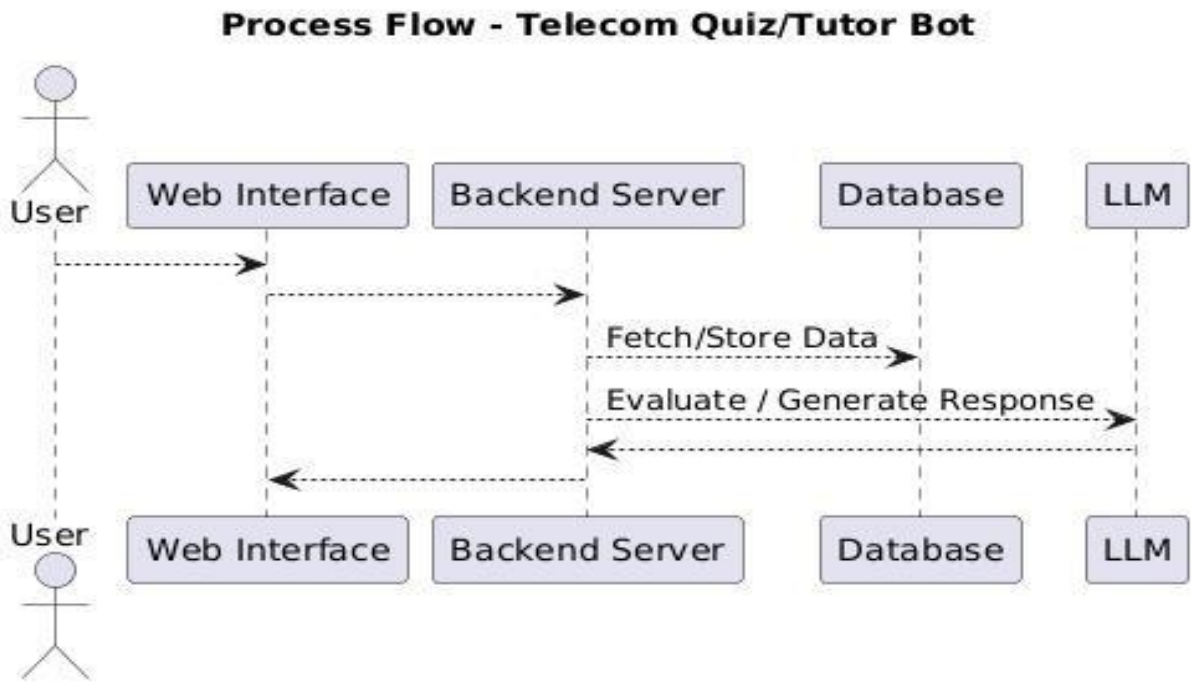
The process flow of the Telecom Quiz/Tutor Bot describes how the system handles user interactions and processes requests to provide intelligent responses and feedback.

Step-by-Step Process Flow

1. **User Interaction**
   The process begins when the user accesses the system through the web interface and selects either quiz mode or chatbot mode.
2. **Input Submission** ○ In quiz mode, the user selects a topic and submits answers to the questions.

- In chatbot mode, the user enters a query related to telecom concepts.

3. **Request Processing**
   The user input is sent to the backend server, which processes the request and determines the appropriate flow (quiz or chatbot).
4. **AI Processing**
   - In quiz mode, the backend forwards the user's answer to the Large Language Model (LLM) for evaluation.
   - In chatbot mode, the backend retrieves relevant context from the vector database and sends it along with the query to the LLM.
5. **Response Generation**
   The LLM generates a response:
   - Quiz mode → Score and feedback
   - Chatbot mode → Answer to the query
6. **Data Storage**
   The system stores user responses, scores, and performance data in the database for future reference.
7. **Output Display**
   The processed result is sent back to the frontend and displayed to the user.



4. Tools & Technologies Used

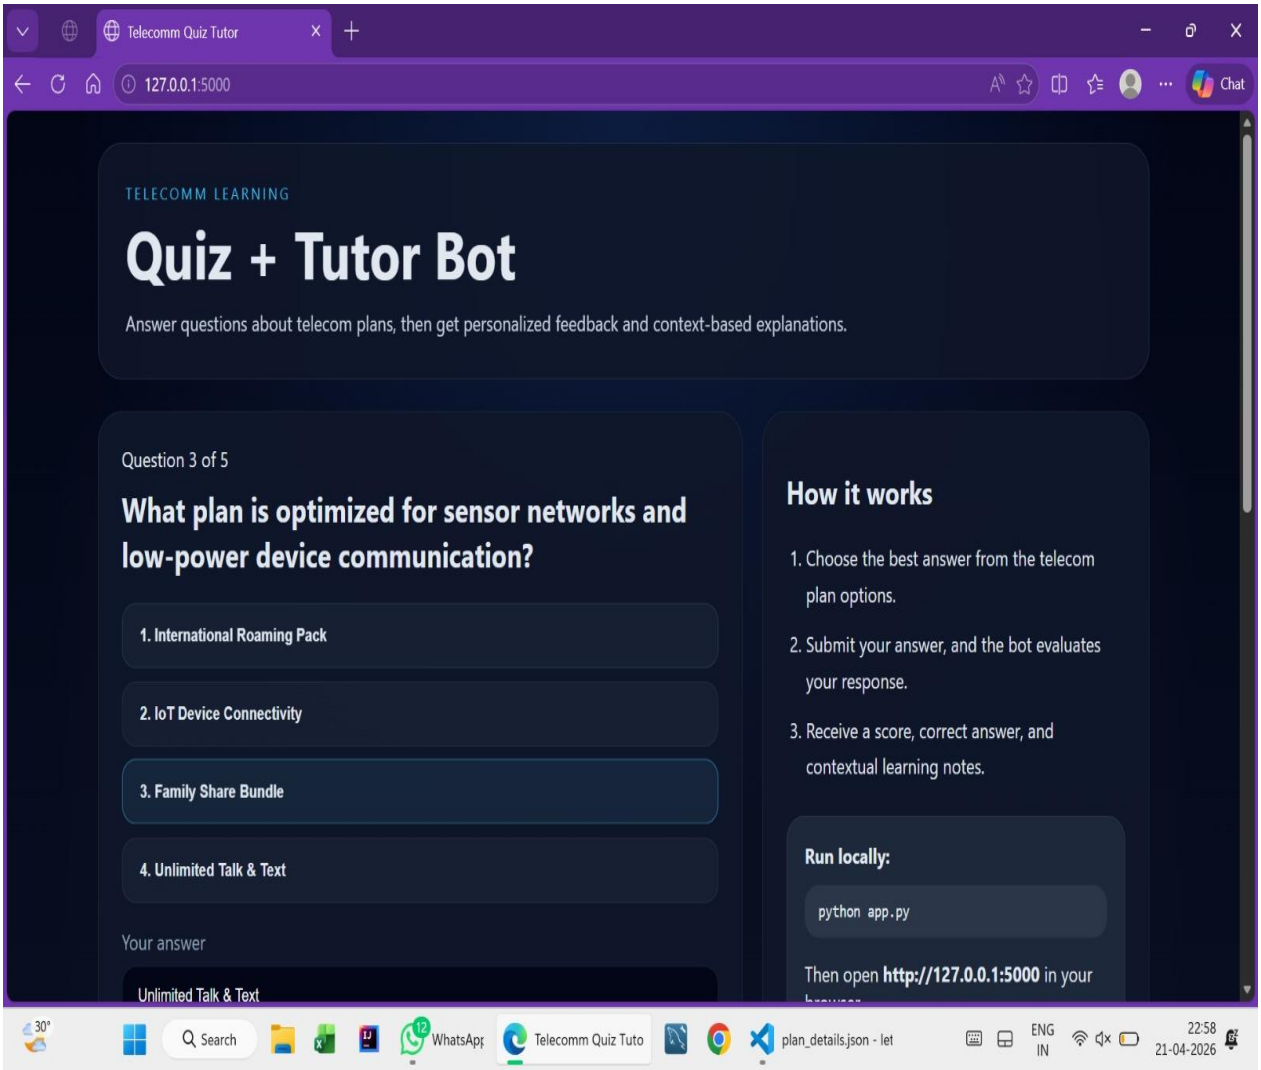
The development of the Telecom Quiz/Tutor Bot utilizes various tools and technologies to enable efficient implementation, AI integration, and smooth system performance.

- Programming Language
  Python is used for backend development and integration with AI services due to its simplicity and strong library support.
- Backend Framework
  FastAPI is used to build high-performance APIs for handling user requests and managing communication between system components.
- Frontend Technologies
  HTML, CSS, and JavaScript are used to design the user interface for quiz interaction and chatbot communication.
- Large Language Model (LLM) API
  APIs such as OpenAI or Google Gemini are used to evaluate user answers and generate intelligent chatbot responses.
- Vector Database
  FAISS or Pinecone is used to store telecom-related knowledge in vector form and retrieve relevant context for chatbot functionality.
- Database
  SQLite or MySQL is used to store structured data such as questions, user responses, and performance records.
- Development Environment
  Visual Studio Code (VS Code) is used for coding, debugging, and project management.
- Version Control System
  Git is used to manage source code, track changes, and enable collaboration among team members.
- Operating System
  The system is developed and tested on Windows/Linux-based environments.

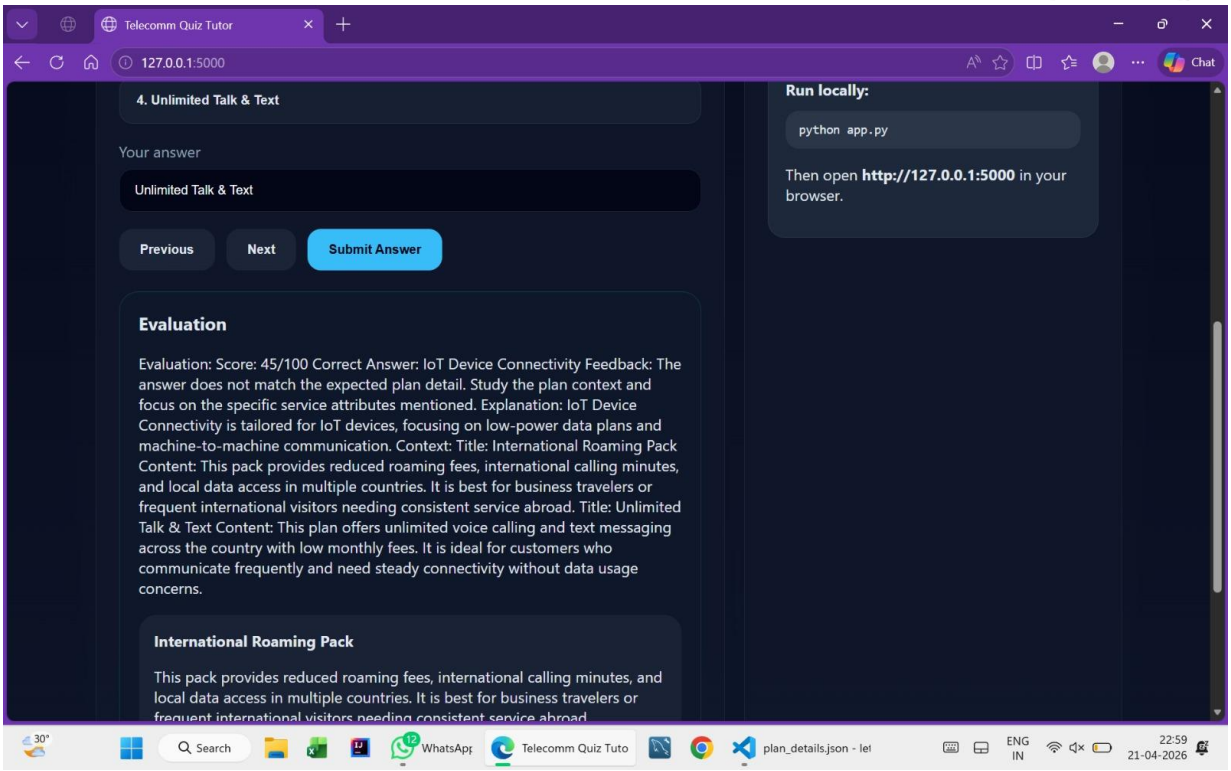
Results & Output

1. Screenshots / outputs

The following screenshots demonstrate the working of the Telecom Quiz/Tutor Bot system, including the quiz interface and AI-based evaluation.



This screenshot shows the main quiz interface of the Telecom Quiz/Tutor Bot system. The user is presented with a telecom-related question along with multiple answer options. The interface displays the current question number (e.g., *Question 3 of 5*), helping users track their progress during the quiz.



This screenshot displays the evaluation result generated after the user submits an answer. The system uses a Large Language Model (LLM) to analyze the response and provide intelligent feedback.

The evaluation includes:

- A score (e.g., 45/100)
- The correct answer (*IoT Device Connectivity*)
- A feedback message explaining why the selected answer was incorrect
- A detailed explanation of the correct concept

The system also provides contextual information about different telecom plans, helping the user understand the differences between options. For example, it explains that *IoT Device Connectivity* is specifically designed for low-power devices and sensor networks.

2. Reports / dashboards

The Telecom Quiz/Tutor Bot includes reporting and dashboard mechanisms to monitor and analyze user performance and system effectiveness. These dashboards provide insights into user activity, quiz results, and learning progress.

The system displays key metrics such as user scores, accuracy percentage, number of attempts, and topic-wise performance. By analyzing these metrics, users can identify their strengths and weaknesses in different telecom concepts.

In addition to performance tracking, the system generates feedback reports that highlight mistakes and provide explanations for incorrect answers. This helps users improve their conceptual understanding and enhances the overall learning experience.

For the chatbot functionality, the system maintains logs of user queries and responses. These logs can be used to analyze frequently asked questions and improve the knowledge base over time.

The data stored in the system also acts as a model for understanding user behavior and learning patterns. This enables the system to provide personalized recommendations and adaptive quizzes in future enhancements.

Overall, the reporting and dashboard features help in monitoring performance, improving learning outcomes, and ensuring the effectiveness of the AI-based system.

3. Key outcomes

The development of the Telecom Quiz/Tutor Bot resulted in significant improvements in the learning experience and system efficiency through the integration of Generative AI.

The project successfully demonstrated how a Large Language Model (LLM) can be used to evaluate user responses intelligently and provide meaningful feedback. Unlike traditional quiz systems, the application offers contextual explanations, helping users understand their mistakes and improve their knowledge.

The system enhanced user engagement by providing an interactive platform that combines quizzes and chatbot-based learning. Users can not only test their knowledge but also clarify doubts in real time, making the learning process more effective and dynamic.

Another important outcome is the implementation of a scalable and modular architecture. The system can handle multiple users and can be easily extended with new topics, features, or improved AI capabilities.

The integration of a vector database for chatbot functionality improved the accuracy and relevance of responses, enabling better context-aware interaction.

Overall, the project demonstrates an effective application of Generative AI in education, improving user understanding, engagement, and system performance.

Conclusion

The Telecom Quiz/Tutor Bot successfully demonstrates the application of Generative AI in enhancing learning within the telecom domain. The system provides an interactive platform where users can test their knowledge through quizzes and receive intelligent feedback based on their responses.

By integrating a Large Language Model (LLM), the system goes beyond traditional quiz applications and offers contextual evaluation along with detailed explanations. This helps users understand their mistakes and improve their conceptual clarity. The inclusion of a chatbot further enhances the system by allowing users to ask questions and receive real-time, accurate responses.

The project also highlights the effectiveness of a modular and scalable architecture, ensuring smooth interaction between different components such as the frontend, backend, AI layer, and data storage. The use of a vector database improves the relevance of chatbot responses, making the system more efficient and intelligent.

Overall, the Telecom Quiz/Tutor Bot provides a practical and effective solution for AI-driven learning, improving user engagement, knowledge retention, and system performance.

Future Scope & Enhancements

The Telecom Quiz/Tutor Bot can be further enhanced by integrating advanced features and technologies to improve its functionality, scalability, and user experience.

One major enhancement is the integration of **voice-based interaction**, allowing users to interact with the system using speech, making it more accessible and user-friendly. Additionally, the user interface can be improved with modern UI/UX designs to provide a more engaging and intuitive experience.

The system can be expanded to include a wider range of telecom topics and realworld case studies, making it more comprehensive. An **analytics dashboard** can be introduced to provide detailed insights into user performance, learning patterns, and progress tracking.

Further improvements can include the use of more advanced AI models to enhance the accuracy and quality of responses. The system can also support

multi-language capabilities, enabling users from different regions to use the platform effectively.

Integration of **adaptive learning techniques** can allow the system to automatically adjust question difficulty based on user performance, providing a personalized learning experience.

In addition, the system can be deployed on cloud platforms to support large-scale usage and improve availability. Stronger security features and performance optimizations can also be implemented for enterprise-level deployment. Overall, these enhancements will make the system more intelligent, scalable, and suitable for real-world applications.
